

Genesys Cloud Auditor

Genesys Cloud Auditor is a Windows desktop and headless audit application for evaluating a **Genesys Cloud** organization for:

- tenant misconfigurations
- cross-endpoint inconsistencies
- stale or orphaned routing dependencies
- telephony ownership contradictions
- data hygiene problems
- operational patterns that may indicate a **probable platform-side issue**

The application collects and correlates data from multiple Genesys Cloud API domains, presents findings in a desktop UI, and exports structured audit results for investigation, change management, and support escalation.

Why This Exists

Genesys Cloud environments often contain issues that are difficult to prove from a single admin screen or a single API response.

A queue may appear healthy but have no realistically serviceable agents. A user profile may claim an extension while telephony assigns it elsewhere. A number may still point to a flow that is stale, deleted, or operationally fragile. An object may look valid in one API surface and contradictory in another.

Genesys Cloud Auditor is designed to detect those situations by comparing multiple authoritative sources and producing **evidence-backed findings** rather than isolated raw data dumps.

Product Goals

Genesys Cloud Auditor is built to answer five practical questions:

1. **What is wrong right now?**
 2. **Which APIs disagree about the same object or relationship?**
 3. **What changed recently that may explain the issue?**
 4. **Who should act on this finding, and what should they do next?**
 5. **Does this appear to be a tenant-side misconfiguration or a probable Genesys platform issue?**
-

Current Capabilities

The current application already provides a strong audit foundation.

Implemented audit checks

Check	Sheet	Severity
-------	-------	----------

Check	Sheet	Severity
Duplicate profile extensions	Ext_Duplicates_Profile	Critical
Extension ownership mismatch	Ext_Ownership_Mismatch	Critical
Assignment vs profile extension mismatch	Ext_Assign_vs_Profile	Warning
Invalid extension values	Invalid_Extensions	Warning
Empty or single-member groups	Empty_Groups	Warning
Empty or duplicate queues	Empty_Queues	Warning
Stale / unpublished Architect flows	Stale_Flows	Warning
Stale token users	Stale_Tokens	Warning
Users missing location	Users_No_Location	Warning
DID mismatches	DID_Mismatches	Warning
Audit log export	Audit_Logs	Info
Operational event export	Operational_Events	Info
Outbound event export	Outbound_Events	Info

Current delivery model

- Windows desktop application for interactive auditing
- Headless runner for scheduled execution
- Multi-sheet Excel workbook export
- Optional scheduled task integration
- Optional SharePoint upload in runner mode

What Makes This Tool Different

The long-term direction of the project is not merely “more checks.”

It is to become a **correlation-driven investigation workbench** that can:

- compare multiple API domains that should describe the same state
- identify contradictions across user, telephony, queue, routing, flow, and topology data
- preserve historical baselines
- classify findings by severity, confidence, and likely owner
- generate escalation-ready evidence for **Genesys Care** when a finding appears platform-side

This is the core product direction described in [ROADMAP.md](#).

Roadmap Direction

The roadmap is organized around five capability layers:

1. **Configuration Integrity**
2. **Cross-Endpoint Correlation**
3. **Operational and Temporal Intelligence**
4. **Actionability and Escalation**
5. **Reporting, History, and UX**

Key roadmap themes include:

- user–station–extension–DID–site integrity correlation
- queue serviceability analysis
- flow dependency and dead-route detection
- edge / site / trunk topology integrity checks
- change-to-symptom timeline correlation
- flapping / instability detection
- historical drift analysis
- support case evidence packet generation

See [ROADMAP.md](#) for the full feature plan.

Audience

This project is intended for:

- Genesys Cloud platform administrators
- cloud telephony and routing engineers
- support engineers and escalation teams
- internal change management teams
- developers building tenant health and audit workflows
